THAPAR INSTITUTE OF ENGINEERING & TECHNOLOGY,
PATIALA, PUNJAB
July 2020-Dec 2020

Table of Contents

S. No.	Experiments	Page No.
1	Experiment-1	1-5
2	Experiment-2	5-10
3	Experiment-3	10-15
4	Experiment-4	16-20
5	Experiment-5	21-22
6	Experiment-6	23-27
7	Experiment-7	28-30
8	Experiment-8	31-34
9	Experiment-9	35-38
10	Experiment-10	39-45

Cloud Computing Lab-1

Part A

1. Write a Python program to print the following string in a specific format (see the output).

Twinkle, twinkle, little star,
How I wonder what you are!
Up above the world so high,
Like a diamond in the sky.
Twinkle, twinkle, little star,
How I wonder what you are

code:

```
print('Twinkle, twinkle, little star,')
print('How I wonder what you are!')
print('Up above the world so high,')
print('Like a diamond in the sky.')
print('Twinkle, twinkle, little star,')
print('How I wonder what you are')
```

output:

```
Twinkle, twinkle, little star,
How I wonder what you are!
Up above the world so high,
Like a diamond in the sky.
Twinkle, twinkle, little star,
How I wonder what you are
>>> smil
```

2. Write a Python program to display the current date and time.

code:

```
from datetime import datetime
now = datetime.now()
print("now =", now)
dt_string = now.strftime("%d/%m/%Y %H:%M:%S")
print("date and time =", dt_string)
```

output:

```
py
now = 2020-08-27 22:12:11.472483
date and time = 27/08/2020 22:12:11
>>> |
```

SMRITI PRIYA

101765006

ENC-7

3. Write a Python program which accepts the radius of a circle from the user and compute the area.

code:

```
n=int(input())
print('area',str(3.14*n**2))
```

output:

```
py
5
area 78.5
>>> |
```

4. Write a Python program which accepts the user's first and last name and print them in reverse order with a space between them.

code:

```
s=input('enter your name ')
l=[i for i in s.split()]
for i in l[::-1]:
    print(i,end=' ')
print()
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/P
enter your name      Priyanshu Priyam Srivastava
Srivastava Priyam Priyanshu
>>> |
```

5. Write a Python program to accept a filename from the user and print the extension of that.

code:

```
s=input('enter file name ')
l=[i for i in s.split('.')]
print('extention ',l[-1])
```

output:

```
>>>
RESTART: C:/Users/hp/AppData/Local/Prog
enter file name      word.txt
extention  txt
>>> |
```

SMRITI PRIYA
101765006
ENC-7

6. Write a Python program to display the first and last colours from a list.

code:

```
s=input('enter the colors seperated by spaces ')
l=[i for i in s.split()]
print('First colour ',l[0])
print('Last colour ',l[-1])
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32/ofro
enter the colors seperated by spaces    red yellow blue pink orange
First colour  red
Last colour  orange
>>> |
```

7. Write a Python program that accepts an integer (n) and computes the value of $n+nn+nnn$.

code:

```
n=input('enter the value ')
print('value of n+nn+nnn is ',end="")
l=int(n*2)
m=int(n*3)
n=int(n)
print(l+m+n)
```

output:

```
enter the value 5
value of n+nn+nnn is 615
>>> |
```

8. Write a Python program to test whether a number is within 100 or 1000 or 2000.

code:

```
n=input('enter the value ')
s='NO'
for i in range(100 ,10001):
    if int(n)==i:
        s='YES'
        break
print(s)
```

SMRITI PRIYA
101765006
ENC-7

output:

```
RESTART: C:/Users/hp/App
enter the value 5
NO
>>> |
```

9. Write a Python program to find whether a given number (accept from the user) is even or odd, print out an appropriate message to the user.

code:

```
n=int(input('enter the value '))
if n%2==0:
    print(str(n)+' is even')
else:
    print(str(n)+' is odd')
```

output:

```
RESTART: C:/Users/hp/AP
enter the value 5
5 is odd
>>> |
```

10. Write a Python program to count the number 4 in a given list.

code:
n=input('Enter the number')
print("Number of 4's present in "+str(n)+" is "+str(n.count('4')))

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/
Enter the number54498444
Number of 4's present in 54498444 is 5
>>> |
```

Part B

To Understand AWS Storage service (S3 and EBS) and summarize the learning in one page.

Amazon S3

SMRITI PRIYA

101765006

ENC-7

Amazon Simple Storage Service is storage for the Internet. It is designed to make web-scale computing easier for developers. Amazon S3 has a simple web services interface that you can use to store and retrieve any amount of data, at any time, from anywhere on the web. It gives any developer access to the same highly scalable, reliable, fast, inexpensive data storage infrastructure that Amazon uses to run its own global network of web sites. The service aims to maximize benefits of scale and to pass those benefits on to developers.

Following are some advantages:

1. Creating buckets: Create and name a bucket that stores data. Buckets are the fundamental containers in Amazon S3 for data storage
2. Storing data – Store an infinite amount of data in a bucket. Upload as many objects as you like into an Amazon S3 bucket. Each object can contain up to 5 TB of data. Each object is stored and retrieved using a unique developer-assigned key.
3. Downloading data – Download your data or enable others to do so. Download your data anytime you like, or allow others to do the same.
4. Permissions – Grant or deny access to others who want to upload or download data into your Amazon S3 bucket. Grant upload and download permissions to three types of users. Authentication mechanisms can help keep data secure from unauthorized access.
5. Standard interfaces – Use standards-based REST and SOAP interfaces designed to work with any internet-development toolkit.

Amazon EBS

Amazon EBS allows you to create storage volumes and attach them to Amazon EC2 instances. Once attached, you can create a file system on top of these volumes, run a database, or use them in any other way you would use block storage. Amazon EBS volumes are placed in a specific Availability Zone where they are automatically replicated to protect you from the failure of a single component. All EBS volume types offer durable snapshot capabilities and are designed for 99.999% availability.

Amazon EBS provides a range of options that allow you to optimize storage performance and cost for your workload. These options are divided into two major categories: SSD-backed storage for transactional workloads, such as databases and boot volumes (performance depends primarily on IOPS), and HDD-backed storage for throughput intensive workloads, such as MapReduce and log processing (performance depends primarily on MB/s).

SSD-backed volumes include the highest performance Provisioned IOPS SSD (io2 and io1) for latency-sensitive transactional workloads and General Purpose SSD (gp2) that balance price and performance for a wide variety of transactional data. HDD-backed volumes include Throughput Optimized HDD (st1) for frequently accessed, throughput intensive workloads and the lowest cost Cold HDD (sc1) for less frequently accessed data.

SMRITI PRIYA
101765006
ENC-7

Elastic Volumes is a feature of Amazon EBS that allows you to dynamically increase capacity, tune performance, and change the type of live volumes with no downtime or performance impact. This allows you to easily right-size your deployment and adapt to performance changes.

Cloud Computing Lab-2

1. Write a Python program to test whether a passed letter is a vowel or not.

code:

```
n=input('Enter the character')
s='aeiouAEIOU'
if n in s:
    print(str(n)+' is a vowel')
else:
    print(str(n)+' is not a vowel')
```

output:

```
Enter the characterA
A is a vowel
Enter the characterE
e is a vowel
Enter the characterP
P is not a vowel
Enter the characterZ
z is not a vowel
>>> |
```

2. Write a Python program to print out a set containing all the colours from color_list_1 which are not present in color_list_2.

```
color_list_1 = set(["White", "Black", "Red"])
color_list_2 = set(["Red", "Green"])
```

code:

```
color_list_1 = set(["White", "Black", "Red"])
color_list_2 = set(["Red", "Green"])
for i in color_list_2:
    if i not in color_list_1:
        print(i)
```

output:

```
>>>
RESTART: C:/Users,
Green
>>> |
```

SMRITI PRIYA

101765006

ENC-7

3. Write a Python program to solve $(x + y) * (x + y)$.

code:

```
x=int(input())
y=int(input())
print('(x+y)*(x+y) is ', end=' ')
print((x+y)**2)
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
2
3
(x+y)*(x+y)  is  25
>>> |
```

4. Write a Python program to calculate the sum of the digits in an integer.

code:

```
n=input()
l=[int(i) for i in n]
print('sum of digits of '+ str(n)+str(sum(l)))
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
457812
sum of digits of 45781227
>>> |
```

5. Write a Python program to calculate the length of a string.

code:

```
n=input()

print('length of '+ str(n)+str(len(n)))
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
564686745
length of 5646867459
>>> |
```

6. Write a Python program to get a single string from two given strings, separated by a space and swap the first two characters of each string.

Sample String : 'abc', 'xyz'

Expected Result : 'xyc abz'

SMRITI PRIYA

101765006

ENC-7

7. Write a Python program to remove the nth index character from a nonempty string.

Code:

```
s=input('enter the string ')
n=int(input('enter the index at which character is to be removed'))
ns=""
ns=s[:n]
ns+=s[n+1:]
print(ns)
```

Output:

```
enter the string      qwerttyuiop
enter the index at which character is to be removed6
      qwerttyuiop
>>> |
```

8. Write a Python script that takes input from the user and displays that input back in upper and lower cases

code:

```
s=input('enter the string ')
print(s.upper())
```

output.

```
RESIARI: C:/Users/np/AppData/Local/Program
enter the string  fewufewiuefichfrui
FEWUFWEWIUEFIOHFRUI
>>> |
```

9. Write a Python function to insert a string in the middle of a string.

code:

```
s=input('enter the string ')
i=input('enter the string to be inserted in the middle')
mid=(len(s)+1)//2
ns=""
ns=s[:mid]
ns+=i
ns+=s[mid+1:]
print(ns)
```

SMRITI PRIYA
101765006
ENC-7

output:

```
| enter the string  qwertyuiop
| enter the string to be inserted in the middleasdf
| qwertasdfuiop
|>>> |
```

10. Write a Python program to print the floating numbers upto 2 decimal places with a sign.

code:

```
a_float = input('Enter the Floating Point Number ')
a_float=float(a_float)
formatted_float = "{:.2f}".format(a_float)
print(formatted_float)
```

output:

```
| RESTART: C:/Users/HP/AppData/Local/Programs
| Enter the Floating Point Number 3.1415278
| 3.14
|>>> |
```

Part B

To Understand AWS compute service (EC2 & lightsail) and summarize the learning in one page.

EC2

Amazon Elastic Compute Cloud (Amazon EC2) provides scalable computing capacity in the Amazon Web Services (AWS) cloud. Using Amazon EC2 eliminates your need to invest in hardware up front, so you can develop and deploy applications faster. You can use Amazon EC2 to launch as many or as few virtual servers as you need, configure security and networking, and manage storage. Amazon EC2 enables you to scale up or down to handle changes in requirements or spikes in popularity, reducing your need to forecast traffic.

Amazon EC2 provides the following features:

1. Virtual computing environments, known as instances
2. Preconfigured templates for your instances, known as Amazon Machine Images (AMIs), that package the bits you need for your server (including the operating system and additional software)
3. Various configurations of CPU, memory, storage, and networking capacity for your instances, known as instance types

SMRITI PRIYA

101765006

ENC-7

4. Secure login information for your instances using key pairs (AWS stores the public key, and you store the private key in a secure place)

5. Storage volumes for temporary data that's deleted when you stop or terminate your instance, known as instance store volumes

6. Persistent storage volumes for your data using Amazon Elastic Block Store (Amazon EBS), known as Amazon EBS volumes

7. Multiple physical locations for your resources, such as instances and Amazon EBS volumes, known as Regions and Availability Zones

8. A firewall that enables you to specify the protocols, ports, and source IP ranges that can reach your instances using security groups

9. Static IPv4 addresses for dynamic cloud computing, known as Elastic IP addresses

10. Metadata, known as tags, that you can create and assign to your Amazon EC2 resources

11. Virtual networks you can create that are logically isolated from the rest of the AWS cloud, and that you can optionally connect to your own network, known as virtual private clouds (VPCs)

Lightsail

AWS Lightsail is an entry-level AWS service, offering app developers access to a configurable virtual private server (VPS) and a suite of easy to use tools. Amazon Lightsail provides an easy, lightweight way for new cloud users to take advantage of AWS' cloud computing services.

Advantages:

1. Simplified UI: It runs through pre-installed software. There will be less confusion for users who are using it for the first time.
2. Familiarity: Developers and companies who use Amazon Lightsail for web hosting and application development will find it more alluring.
3. Affordability: The subscription is free for the first month and is \$5/month for the cheapest tier.
4. Reliability: The need for replacement is rare as the services run through Amazon infrastructure and data centers.

AWS Lightsail is mostly used by first-time cloud users and developers looking to test out app prototypes, or by startups and small scale production studios for whom the limitations of the Lightsail environment are sufficient.

Cloud Computing Lab-3

Part A

1. Write a Python program to sum all the items in a list

code:

```
l=[1,2,3,4,5,6443,3,68]
print(l)
print('sum',sum(l))
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Pro
[1, 2, 3, 4, 5, 6443, 3, 68]
sum 6529
>>> |
```

2. Write a Python program to get the largest number from a list.

code:

```
l=[1,2,3,4,5,6443,3,68]
print('list',l)
print('largest number',sum(l))
```

output:

```
list [1, 2, 3, 4, 5, 6443, 3, 68]
largest number 6529
>>> |
```

3. Write a Python program to get a list, sorted in increasing order by the last element in each tuple from a given list of non-empty tuples

code:

```
l=[(1,2,3,4,5,64,8,3,68)]
print('list',l)
print('sorted in increasing order',sum(l))
```

output:

```
list [(1, 2, 3, 4, 5, 64, 8, 3, 68)]
sorted in increasing order 158
>>> |
```

4. Write a Python program to remove duplicates from a list

code:

```
l=[1,2,3,4,5,64,8,3,6,8,64,6]
print('list',l)
print('after removing duplicates ',set(l))
```

SMRITI PRIYA
101765006
ENC-7

output:

```
| list [1, 2, 3, 4, 5, 64, 8, 3, 6, 8, 64, 6]
| after removing duplicates {64, 1, 2, 3, 4, 5, 6, 8}
>>> |
```

5. Write a Python program to find the list of words that are longer than n from a given list of words

code:

```
s=input('enter the words in list ')
l=[i for i in s.split()]
n=int(input('enter th threshold '))
for i in l:
    if len(i)>n:
        print(i)
```

output:

```
| RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
| enter the words in list apple banana orange guava ,pineapple
| enter th threshold 5
| banana
| orange
| ,pineapple
>>> |
```

6. Write a Python program to get the difference between the two lists

code:

```
s=input('enter numbers in first list ')
t=input('enter numbers in second list ')
s=[int(i) for i in s.split()]
t=[int(i) for i in t.split()]
l=[s[i]-t[i] for i in range(len(s))]
print('difference between the lists are ',*l)
```

output:

```
| -----
| enter numbers in first list 1 2 3 4
| enter numbers in second list 5 2 1 3
| difference between the lists are -4 0 2 1
>>> |
```

SMRITI PRIYA
101765006
ENC-7

7. Write a Python script to add a key to a dictionary
code:

```
dic1={'1':10, '2':20}
print(dic1)
i=input('enter the key in dict ')
v=input('enter the value of the key ')
dic1[i]=v
print(dic1)
```

output:

```
...
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
{'1': 10, '2': 20}
enter the key in dict 5
enter the value of the key 40
{'1': 10, '2': 20, '5': '40'}
>>> |
```

8. Write a Python script to concatenate following dictionaries to create a new one.

Sample Dictionary :

```
dic1={1:10, 2:20}
dic2={3:30, 4:40}
dic3={5:50,6:60}
```

Expected Result : { 1: 10, 2: 20, 3: 30, 4: 40, 5: 50, 6: 60}

code:

```
from collections import Counter
dic1={1:10, 2:20}
print(dic1)
dic2={3:30, 4:40}
dic3={5:50,6:60}
print(dic2)
print(dic3)
dic1=Counter(dic1)
dic2=Counter(dic2)
dic3=Counter(dic3)
dic4=Counter()
dic4=dic1+dic2+dic3
print(dic4)
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
{1: 10, 2: 20}
{3: 30, 4: 40}
{5: 50, 6: 60}
Counter({6: 60, 5: 50, 4: 40, 3: 30, 2: 20, 1: 10})
>>> |
```

SMRITI PRIYA
101765006
ENC-7

9. Write a Python program to remove a key from a dictionary
code:

```
from collections import Counter
dic1={1:10, 2:20}
#print(dic1)
dic2={3:30, 4:40}
dic3={5:50,6:60}
#print(dic2)
#print(dic3)
dic1=Counter(dic1)
dic2=Counter(dic2)
dic3=Counter(dic3)
dic4=Counter()
dic4=dic1+dic2+dic3
print(dic4)
dic4=dict(dic4)
del(dic4[5])
print(dic4)
```

output:

```
```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32/
counter({6: 60, 5: 50, 4: 40, 3: 30, 2: 20, 1: 10})
1: 10, 2: 20, 3: 30, 4: 40, 6: 60
```
```

10. Write a Python program to multiply all the items in a dictionary
code:

```
from collections import Counter
dic1={1:10, 2:20}
#print(dic1)
dic2={3:30, 4:40}
dic3={5:50,6:60}
#print(dic2)
#print(dic3)
dic1=Counter(dic1)
dic2=Counter(dic2)
dic3=Counter(dic3)
dic4=Counter()
dic4=dic1+dic2+dic3
print(dic4)
dic4=dict(dic4)
mul=1
```

SMRITI PRIYA

101765006

ENC-7

for i in dic4:

 mul*=dic4[i]

print(mul)

output:

```
>>>
RESTART: C:/Users/hp/AppData/Local
Counter({6: 60, 5: 50, 4: 40, 3: 3
7200000000
'
```

Part B

To Understand AWS database service (Aurora, Redshift & DynamoDB) and summarize the learning in one page.

Aurora

Amazon Aurora (Aurora) is a fully managed relational database engine that's compatible with MySQL and PostgreSQL. Aurora includes a high-performance storage subsystem. Its MySQL- and PostgreSQL-compatible database engines are customized to take advantage of that fast distributed storage. The underlying storage grows automatically as needed, up to 64 tebibytes (TiB). Aurora also automates and standardizes database clustering and replication, which are typically among the most challenging aspects of database configuration and administration. Aurora is part of the managed database service Amazon Relational Database Service (Amazon RDS). Amazon RDS is a web service that makes it easier to set up, operate, and scale a relational database in the cloud. If you are not already familiar with Amazon RDS

Redshift

Redshift is a fully managed, petabyte-scale data warehouse service in the cloud. It is also used to perform large scale database migrations.

Redshift's column-oriented database is designed to connect to SQL-based clients and business intelligence tools, making data available to users in real time. Based on PostgreSQL 8, Redshift delivers fast performance and efficient querying that help teams make sound business analyses and decisions.

Redshift is Amazon's analytics database, and is designed to crunch large amounts of data as a data warehouse. Those interested in Redshift should know that it consists of clusters of databases with dense storage nodes, and allows you to even run traditional relational databases in the cloud.

Amazon Redshift automatically handles many of the time-consuming tasks associated with managing your own data warehouse, including:

Setup: With Amazon Redshift, you simply create a data warehouse cluster, define your schema, and begin loading and querying your data. You don't have to manage provisioning, configuration or patching.

SMRITI PRIYA

101765006

ENC-7

Data Durability: Amazon Redshift replicates your data within your data warehouse cluster and continuously backs up your data to Amazon S3, which is designed for eleven nines of durability. Amazon Redshift mirrors each drive's data to other nodes within your cluster. If a drive fails, your queries will continue with a slight latency increase while Redshift rebuilds your drive from replicas. In case of node failure(s), Amazon Redshift automatically provisions new node(s) and begins restoring data from other drives within the cluster or from Amazon S3. It prioritizes restoring your most frequently queried data so your most frequently executed queries will become performant quickly.

Scaling: You can add or remove nodes from your Amazon Redshift data warehouse cluster with a single API call or via a few clicks in the AWS Management Console as your capacity and performance needs change. You can also schedule your scaling and resize operations by using the scheduler capability in Redshift.

Automatic Updates and Patching: Amazon Redshift automatically applies upgrades and patches your data warehouse so you can focus on your application and not on its administration.

Exabyte Scale Query Capability: Redshift Spectrum enables you to run queries against exabytes of data in Amazon S3. There is no loading or ETL required. Even if you don't store any of your data in Amazon Redshift, you can still use Redshift Spectrum to query datasets as large as an exabyte in Amazon S3

DynamoDb

Amazon DynamoDB is a fully managed NoSQL database service that provides fast and predictable performance with seamless scalability. DynamoDB lets you offload the administrative burdens of operating and scaling a distributed database so that you don't have to worry about hardware provisioning, setup and configuration, replication, software patching, or cluster scaling. DynamoDB also offers encryption at rest, which eliminates the operational burden and complexity involved in protecting sensitive data.

DynamoDB provides on-demand backup capability. It allows you to create full backups of your tables for long-term retention and archival for regulatory compliance needs. DynamoDB allows you to delete expired items from tables automatically to help you reduce storage usage and the cost of storing data that is no longer relevant.

DynamoDB is a particularly good fit for the following use cases:

1. Applications with large amounts of data and strict latency requirements. As your amount of data scales, JOINs and advanced SQL operations can slow down your queries. With DynamoDB, your queries have predictable latency up to any size, including over 100 TBs!
2. Serverless applications using AWS Lambda. AWS Lambda provides auto-scaling, stateless, ephemeral compute in response to event triggers. DynamoDB is accessible via an HTTP API and performs authentication & authorization via IAM roles, making it a perfect fit for building Serverless applications.
3. Data sets with simple, known access patterns. If you're generating recommendations and serving them to users, DynamoDB's simple key-value access patterns make it a fast, reliable choice.

Cloud Computing Lab-4

Part A

1. Write a Python program to create a tuple with different data types.

code:

```
tup1 = ('physics', 'chemistry', 1997, 2000)
tup2 = (1, 2, 3, 4, 5, 6, 7 )
print("tup1[0]:", tup1[0])
print("tup2[1:5]: ", tup2[1:5])
```

output:

```
tup1[0]: physics
tup2[1:5]: (2, 3, 4, 5)
>>> |
```

2. Write a Python program to add an item in a tuple

code:

```
tup1 = ('physics', 'chemistry', 1997, 2000)
print('before updating',tup1)
#tup2 = (1, 2, 3, 4, 5, 6, 7 )
ad=input('enter the value to be updated to tuple ')
tup2=(ad,)
print(tup1+tup2)
```

output:

```
before updating ('physics', 'chemistry', 1997, 2000)
enter the value to be updated to tuple Food Technology
('physics', 'chemistry', 1997, 2000, 'Food Technology')
>>> |
```

3. Write a Python program to convert a tuple to a string

code:

```
tup1 = ('physics', 'chemistry', 1997, 2000)
print('tuple',tup1)
#tup2 = (1, 2, 3, 4, 5, 6, 7 )
#ad=input('enter the value to be updated to tuple ')
#tup2=(ad,)
s=""
for i in tup1:
    s+=str(i)+'
print('String ',s)
```

SMRITI PRIYA
101765006
ENC-7

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/tuple ('physics', 'chemistry', 1997, 2000)
String physics chemistry 1997 2000
>>> |
```

4. Write a Python program to get the 4th element and 4th element from last of a tuple.

code:

```
tup1 = ('physics', 'chemistry', 1997, 2000,'Food Technology','Astrophysics','String Theory','infinite')
print('tuple',tup1)
#tup2 = (1, 2, 3, 4, 5, 6, 7 )
#ad=input('enter the value to be updated to tuple ')
#tup2=(ad,)
print('4th element is ',tup1[4])
print('4th element from last is ',tup1[-1])
```

output:

```
KODIARI: C:/Users/hp/AppData/Local/Programs/Python/tuple ('physics', 'chemistry', 1997, 2000, 'Food Technology', 'Astrophysics', 'String Theory', 'infinite')
4th element is Food Technology
4th element from last is infinite
>>> |
```

5. Write a Python program to find the repeated items of a tuple

code:

```
t=('A','BE','a','b','W','A','b','W')
print(t)
l=[]
for i in t:
    if t.count(i)>1 and i not in l:
        l.append(i)
print(*l)
```

output:

```
('A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W')
A b W
>>> |
```

6. Write a Python program to check whether an element exists within a tuple

code:

SMRITI PRIYA
101765006
ENC-7

```
t=('A','BE','a','b','W','A','b','W')
print(t)

i=input('enter the element to be checked ')
if i in t:
    s='Yes'
else:
    s='No'
print(s)
```

output:

```
('A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W')
enter the element to be checked a
Yes
('A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W')
enter the element to be checked z
No
>>> |
```

7. Write a Python program to convert a list to a tuple

code:

```
t=['A','BE','a','b','W','A','b','W']
print('List',t)
ts=tuple(t)
print('tuple',ts)
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/Python37-32
List ['A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W']
tuple ('A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W')
>>> |
```

8. Write a Python program to slice a tuple

code:

```
tup1 = ('physics', 'chemistry', 1997, 2000)
tup2 = (1, 2, 3, 4, 5, 6, 7 )
print("tup1[0]:", tup1[0])
print("tup2[1:5]: ", tup2[1:5])
```

output:

SMRITI PRIYA

101765006

ENC-7

```
tup1[0]: physics
tup2[1:5]: (2, 3, 4, 5)
>>> |
```

9. Write a Python program to find the length of a tuple

code:

```
t=['A','BE','a','b','W','A','b','W']
#print('List',t)
ts=tuple(t)
print('tuple',ts)
print('length ',len(ts))
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/
tuple ('A', 'BE', 'a', 'b', 'W', 'A', 'b', 'W')
length 8
>>> |
```

10. Write a Python program to convert a list of tuples into a dictionary

code:

```
t=((‘a’,97),(‘b’,98),(‘c’,99),(‘d’,100))
print(‘tuple’,t)
d={}
for pair in t:
    d[pair[0]]=pair[1]
print(‘dict’,d)
```

output:

```
RESTART: C:/Users/hp/AppData/Local/Programs/Python/
tuple ((‘a’, 97), (‘b’, 98), (‘c’, 99), (‘d’, 100))
dict {‘a’: 97, ‘b’: 98, ‘c’: 99, ‘d’: 100}
>>> |
```

Part B

To Understand Map-Reduce Paradigm and summarize the learning in one page.

MapReduce is a programming framework that allows us to perform distributed and parallel processing on large data sets in a distributed environment.

MapReduce consists of two distinct tasks — Map and Reduce.

As the name MapReduce suggests, reducer phase takes place after the mapper phase has been completed.

SMRITI PRIYA

101765006

ENC-7

So, the first is the map job, where a block of data is read and processed to produce key-value pairs as intermediate outputs.

The output of a Mapper or map job (key-value pairs) is input to the Reducer.

The reducer receives the key-value pair from multiple map jobs.

Then, the reducer aggregates those intermediate data tuples (intermediate key-value pair) into a smaller set of tuples or key-value pairs which is the final output.

Advantages of MapReduce:

1. Parallel Processing

In MapReduce, we are dividing the job among multiple nodes and each node works with a part of the job simultaneously. So, MapReduce is based on Divide and Conquer paradigm which helps us to process the data using different machines. As the data is processed by multiple machines instead of a single machine in parallel, the time taken to process the data gets reduced by a tremendous amount

2. Data Locality

Instead of moving data to the processing unit, we are moving the processing unit to the data in the MapReduce Framework. In the traditional system, we used to bring data to the processing unit and process it. But, as the data grew and became very huge, bringing this huge amount of data to the processing unit posed the following issues:

- a. Moving huge data to processing is costly and deteriorates the network performance.
- b. Processing takes time as the data is processed by a single unit which becomes the bottleneck.
- c. Master node can get over-burdened and may fail.

As data is distributed among multiple nodes where each node processes the part of the data residing on it, it has the following advantages

1. It is very cost effective to move the processing unit to the data.
2. The processing time is reduced as all the nodes are working with their part of the data in parallel.
3. Every node gets a part of the data to process and therefore, there is no chance of a node getting overburdened.

SMRITI PRIYA

Cloud Computing Lab-5

1. Create a text file named “INPUT” that comprises of some text. Using Mapper and Reducer program generate a KEY and COUNT matrix for the file.

code:

```
from functools import reduce
a=reduce(lambda output, current: output + [(current, ord(current))], 'abcde', [])
print('with reduce ',a)
print('dictionary ',dict(a))
```

output:

2. XYZ.com is an online music website where users listen to various tracks, the data gets collected like shown below. Write a map reduce program to get following stats

1. Number of unique listeners
 2. Number of times the track was shared with others
 3. Number of times the track was listened to on the radio
 4. Number of times the track was listened to in total
 5. Number of times the track was skipped on the radio

The data is coming in log files and looks like as shown below.

UserId|TrackId|Shared|Radio|Skip

111115|222|0|1|0

111113|225|1|0|0

111117|223|0|1|1

111115|225|1|0|0

code:

output:

3. Five persons A, B, C, D, E have a friendship relation as shown below.

A → B C D

B->ACDF

C->ABDF

D->ABCDE

F -> B C D

Identify who is having maximum friends, minimum friends and no friends.

code:

SMRITI PRIYA

101765006

ENC-7

```
d={'A':'BCD','B':'ACDE','C':'ABDE','D':'ABCE','E':'BCD'}
print(d)
maxx='A'
minn='A'
for i in d:
    if len(d[i])>len(d[maxx]):
        maxx=i
    if len(d[i])<len(d[maxx]):
        minn=i
print(maxx,' has maximum number of friends')
print(minn,' has minimum number of friends ')
```

output:

```
{'A': 'BCD', 'B': 'ACDE', 'C': 'ABDE', 'D': 'ABCE', 'E': 'BCD'}
B  has maximum number of friends
E  has minimum number of friends
>>> |
```

Experiment 6

To Launch an AWS EC2 instance and connect to it using PuTTY.

Elaboration of the terms used:-

AWS EC2 Instance:-

Amazon Elastic Compute Cloud (Amazon EC2) is a web service that provides secure, resizable compute capacity in the cloud. It is designed to make web-scale cloud computing easier for developers. Amazon EC2's simple web service interface allows you to obtain and configure capacity with minimal friction. It provides with complete control of your computing resources and lets you run on Amazon's proven computing environment. There are 5 types of instances:- General purpose, Compute Optimized, Memory optimized, Accelerated Computing and Storage Optimized. We will be using General purpose instance as it provides a balance of compute, memory and networking resources, and can be used for a variety of diverse workloads. These instances are ideal for applications that use these resources in equal proportions such as web servers and code repositories.

PuTTY:-

PuTTY is a free and open-source terminal emulator, serial console and network file transfer application. It supports several network protocols, including SCP, SSH, Telnet, rlogin, and raw socket connection. It can also connect to a serial port. PuTTY supports many variations on the secure remote terminal, and provides user control over the SSH encryption key and protocol version, alternate ciphers such as AES, 3DES, RC4, Blowfish, DES, and Public-key authentication. PuTTY uses own format of key files – PPK.

SSH:-

Secure Shell is a cryptographic network protocol for operating network services securely over an unsecured network. Typical applications include remote command-line, login, and remote command execution, but any network service can be secured with SSH. The SSH protocol uses encryption to secure the connection between a client and a server. All user authentication, commands, output, and file transfers are encrypted to protect against attacks in the network.

Steps to launch and connect to EC2 instance:-

- Go to AWS educate and open AWS Management console. Now, click on Launch a Virtual Machine with EC2.

AWS Management Console

AWS services

AWS Training

- Now, choose an Amazon machine language(AMI). It is a template that contains the software configuration (operating system, application server, and applications) required to launch instance. Here we choose **Ubuntu Server 18.04 LTS**

Step 1: Choose an Amazon Machine Image (AMI)

Free tier eligible Root device type: ebs Virtualization type: hvm ENA Enabled: Yes

Are you launching a database instance? Try Amazon RDS.

Amazon RDS

Launch a database using RDS

Ubuntu Server 18.04 LTS (HVM), SSD Volume Type - ami-0817d428a6fb68645 (64-bit x86) / ami-0f2b11fdc1647918 (64-bit Arm)

Select

Free tier eligible Root device type: ebs Virtualization type: hvm ENA Enabled: Yes

64-bit (Arm)

64-bit (x86)

Microsoft Windows Server 2019 Base - ami-0eb7fbcc77e5e6ec6

Select

64-bit (x86)

Windows Free tier eligible Root device type: ebs Virtualization type: hvm ENA Enabled: Yes

64-bit (x86)

Deep Learning AMI (Ubuntu 18.04) Version 34.0 - ami-06a25ee8966373068

Select

64-bit (x86)

Root device type: ebs Virtualization type: hvm ENA Enabled: Yes

- Choose the Instance type that you require according to your need. Here we select general purpose t2.micro instance which consists of 1 CPU with 1GiB Memory and EBS instance storage. Then click Review and Launch. After reviewing, Launch the instance.

Step 2: Choose an Instance Type

Filter by: All instance types Current generation Show/Hide Columns

Currently selected: t2.micro (Variable ECUs, 1 vCPUs, 2.5 GHz, Intel Xeon Family, 1 GiB memory, EBS only)

Family	Type	vCPUs	Memory (GiB)	Instance Storage (GB)	EBS-Optimized Available	Network Performance	IPv6 Support
General purpose	t2.nano	1	0.5	EBS only	-	Low to Moderate	Yes
General purpose	t2.micro <small>Free tier eligible</small>	1	1	EBS only	-	Low to Moderate	Yes
General purpose	t2.small	1	2	EBS only	-	Low to Moderate	Yes
General purpose	t2.medium	2	4	EBS only	-	Low to Moderate	Yes
General purpose	t2.large	2	8	EBS only	-	Low to Moderate	Yes
General purpose	t2.xlarge	4	16	EBS only	-	Moderate	Yes
General purpose	t2.2xlarge	8	32	EBS only	-	Moderate	Yes
General purpose	t3a.nano	2	0.5	EBS only	Yes	Up to 5 Gigabit	Yes
General purpose	t3a.small	1	1	EBS only	-	Up to 5 Gigabit	Yes

Cancel Previous **Review and Launch** Next: Configure Instance Details

- On launching, create a new key pair. This key pair will allow you to connect to the instance securely. Type a key pair name and download the key pair. Keep it in a safe and accessible location. After this click on Launch Instance

- Click on view instance. You would be able to see the instance that you created as shown below

Launch Instance Connect Actions

Filter by tags and attributes or search by keyword

Name	Instance ID	Instance Type	Availability Zone	Instance State	Status Checks	Alarm Status	Public DNS (IPv4)	IPv4 Public IP	IPv6
Ravi15	i-03d3cc11d64295a1e	t2.micro	us-east-1b	running	2/2 checks ...	None	ec2-3-94-253-124.com...	3.94.253.124	

Note the value of IPv4 public IP as it will be used to connect to the instance. After this click on Connect.

Now choose the connection method as standalone SSH client.

Connect to your instance

X

Connection method

A standalone SSH client [\(i\)](#)

Session Manager [\(i\)](#)

EC2 Instance Connect (browser-based SSH connection) [\(i\)](#)

To access your instance:

1. Open an SSH client. (find out how to [connect using PuTTY](#))
2. Locate your private key file (RavideepS15.pem). The wizard automatically detects the key you used to launch the instance.
3. Your key must not be publicly viewable for SSH to work. Use this command if needed:

```
chmod 400 RavideepS15.pem
```

4. Connect to your instance using its Public DNS:

```
ec2-3-94-253-124.compute-1.amazonaws.com
```

Example:

```
ssh -i "RavideepS15.pem" ubuntu@ec2-3-94-253-124.compute-1.amazonaws.com
```

Please note that in most cases the username above will be correct, however please ensure that you read your AMI usage instructions to ensure that the AMI owner has not changed the default AMI username.

If you need any assistance connecting to your instance, please see our [connection documentation](#).

[Close](#)

- Now download PuTTY from the internet and install it. After installation open PuTTYgen to generate a key. After opening, select the private key file that you downloaded before and load it. Also put a key passphrase. This is a password that you would need to enter for accessing the instance you created. After this select parameter as RSA and click on save private key and download the key.

- Now open PuTTY. Under sessions category, put host name as the IPv4 Public address that you noted in the beginning and save the session by giving a name (Ubuntu here).

Under Auth section, browse the putty file that you generated thorough PuTTYgen in the previous step. Click open. A command window will open. Type the name of the session in login as and password in passphrase section.

After the correct input of username and password, the command line of the Ubuntu operating system will open

```
ubuntu@ip-172-31-45-160: ~
Swap usage: 0%
0 packages can be updated.
0 updates are security updates.

The programs included with the Ubuntu system are free software;
the exact distribution terms for each program are described in the
individual files in /usr/share/doc/*/*copyright.

Ubuntu comes with ABSOLUTELY NO WARRANTY, to the extent permitted by
applicable law.

To run a command as administrator (user "root"), use "sudo <command>".
See "man sudo_root" for details.

ubuntu@ip-172-31-45-160:~$ cd /
ubuntu@ip-172-31-45-160:/$ ls
bin  home          lib64    opt   sbin  tmp      vmlinuz.old
boot initrd.img    lost+found  proc  snap  usr
dev   initrd.img.old media    root   srv   var
etc   lib           mnt     run    sys   vmlinuz
ubuntu@ip-172-31-45-160:/$
```

Experiment 7

To create an AWS S3 bucket and load an object into it. Create a backup bucket.

Elaboration of the terms used:-

AWS S3:-

Amazon S3 or Amazon Simple Storage Service is a service offered by Amazon Web Services that provides object storage through a web service interface. It is an object storage service that offers industry-leading scalability, data availability, security, and performance. Amazon S3 uses the same scalable storage infrastructure that Amazon.com uses to run its global e-commerce network. Customers of all sizes and industries can use it to store and protect any amount of data for a range of use cases, such as websites, mobile applications, backup and restore, archive, enterprise applications, IoT devices, and big data analytics. Amazon S3 provides easy-to-use management features so you can organize your data and configure finely-tuned access controls to meet your specific business, organizational, and compliance requirements.

Steps to create bucket and load object into it:-

1. Go to AWS educate and open AWS Management console. Now, go to all services and click on S3 under Storage category.

The screenshot shows the AWS Management Console homepage. On the left, there's a sidebar with 'AWS services' and a 'Find Services' search bar. Below that is a 'Recently visited services' section with 'EC2'. Under 'All services', several categories are listed: Compute, Blockchain, Security, Identity, & Compliance; EC2, Satellite, IAM; Lambda, Ground Station, Resource Access Manager; Batch, Quantum Technologies, Cognito; Elastic Beanstalk, Amazon Braket, Secrets Manager; Serverless Application Repository, CloudWatch, GuardDuty; AWS Outposts, Auto Scaling, Inspector; EC2 Image Builder, CloudFormation, Amazon Macie; and EC2 Image Builder, CloudWatch Metrics, AWS Single Sign-On. At the bottom of the sidebar, 'Containers' and 'Storage' are listed, with 'Storage' being highlighted by a red box. To the right, there are sections for 'Explore AWS' featuring Amazon Redshift, AWS Fargate, Amazon S3, and AWS Marketplace, along with links to download the AWS mobile app and learn more about various AWS services.

2. Now, click on create bucket option in Amazon S3

The screenshot shows the Amazon S3 console interface. On the left, there's a sidebar with options like 'Buckets', 'Batch operations', 'Access analyzer for S3', and 'Block public access (account settings)'. The main area is titled 'Welcome to Amazon S3. Create new buckets or select an existing bucket to view and configure properties.' It features a search bar and buttons for 'Edit public access settings', 'Empty', and 'Delete'. A prominent red box highlights the '+ Create bucket' button. At the bottom, it says 'You do not have any buckets. Here is how to get started with Amazon S3.' On the top right, there are links for 'Documentation', 'Discover the console', and account information.

3. Now type a unique bucket name and check the necessary permissions required. Review the setting and after that click on Create Bucket.

This screenshot shows the 'Create bucket' wizard. The first step, 'Name and region', is selected and has a red box around it. It shows a bucket named 'ravisingh' in the 'US East (N. Virginia)' region. Below this, the 'Configure options' and 'Set permissions' steps are shown with their respective icons. The 'Review' step is the fourth step, indicated by a circled '4'. At the bottom right of the wizard, the 'Create bucket' button is highlighted with a red box.

4. You will be able to see the created bucket on the list on buckets. Click on the name of bucket and further click on Upload to upload on object in the bucket

This screenshot shows the details page for the 'ravisingh' bucket. The top navigation bar shows 'Amazon S3 > ravisingh'. The main content area shows the bucket name 'ravisingh'. Below it, there are tabs for 'Overview' (which is selected), 'Properties', 'Permissions', 'Management', and 'Access points'. A red box highlights the 'Upload' button in the toolbar below these tabs. Other buttons in the toolbar include '+ Create folder', 'Download', 'Actions', 'Versions', 'Hide', and 'Show'. The status 'US East (N. Virginia)' is shown on the right. A message at the bottom says 'This bucket is empty. Upload new objects to get started.'

5. Browse the file to be uploaded and click on Add file. Set necessary permissions and properties required. Review the settings and click upload.

Now create a folder in this bucket (eg. My experiments). Use the bucket settings and click save. Now right click on the file and move the file to this newly created folder.

The screenshot shows the AWS S3 console interface. At the top, there are buttons for Upload, Create folder, Download, Actions, Versions, Hide, and Show. The location is set to US East (N. Virginia). Below the toolbar, a table lists objects. The first object is a folder named 'My experiments'. A red box highlights the encryption settings dialog for this folder. The dialog shows the following options:

- None (Use bucket settings)
- AES-256
- AWS-KMS

Below the dialog, there are Save and Cancel buttons. The main table below shows the folder 'My experiments' and a file '101715128_Cloud_exp6.pdf'. The file details are: Last modified: Sep 18, 2020 7:38:25 PM GMT+0530, Size: 2.3 MB, Storage class: Standard.

6. Create a backup folder (eg. Backuppravisingh) in AWS S3. Go to the previous bucket and go to the file. Right click on the file and select copy. Select the destination as the backup folder and click choose. Your backup will be created.

The screenshot shows the AWS S3 console interface. The location is set to US East (N. Virginia). Below the toolbar, a table lists objects. The first object is a file named '101715128_Cloud_exp6.pdf'. A red box highlights this file entry. The main table below shows the file '101715128_Cloud_exp6.pdf'. The file details are: Last modified: Sep 18, 2020 7:49:24 PM GMT+0530, Size: 2.3 MB, Storage class: Standard.

Experiment 8

Aim: To Build Amazon Virtual Private Cloud (Amazon VPC) Using the VPC Wizard.

Introduction:

Amazon VPC and Its Types:

AWS provides a lot of services; these services are sufficient to run your architecture. The backbone for the security of this architecture is VPC (Virtual Private Cloud). VPC is basically a private cloud in the AWS environment that helps you to use all the services by AWS in your defined private space. You have control over the virtual network and you can also restrict the incoming traffic using security groups.

Overall, VPC helps you to secure your environment and give you a complete authority of incoming traffic. There are two types of VPCs, Default VPC that is by default created by Amazon and Non-Default VPC that is created by you to suffice your security needs.

Route Tables:

Route table can be understood as a table that contains rules for routing traffic within and outside a subnet. The route table is also used to add Internet Gateway to the subnet. There can be multiple route tables in a VPC.

Internet Gateway:

Internet Gateway is a very important component that allows your instance to connect to the internet. It allows the user to make the subnet public by providing a route to the internet. With the help of Internet Gateway, an instance can access the internet and the resources outside instance can access the instance.

STEPS TO BIULD VPC:

1 Navigate to the VPC Dashboard. Here you will see a “Launch VPC Wizard” click on it.

The screenshot shows the AWS VPC Dashboard. At the top, there are buttons for "Launch VPC Wizard" (highlighted in orange) and "Launch EC2 Instances". A note below says "Note: Your Instances will launch in the US East (N. Virginia) region." On the left, a sidebar lists various VPC components: New VPC Experience, VPC Dashboard (selected), Your VPCs, Subnets, Route Tables, Internet Gateways, Egress Only Internet Gateways, Carrier Gateways, DHCP Options Sets, Elastic IPs, Managed Prefix Lists, Endpoints, Endpoint Services, NAT Gateways, Peering Connections, SECURITY (Network ACLs), and a feedback link. The main content area is titled "Resources by Region" and shows counts for N. Virginia: VPCs (1), Subnets (6), Route Tables (1), Internet Gateways (1), Egress-only Internet Gateways (0), and DHCP options sets (1). It also shows counts for N. Virginia: NAT Gateways (0), VPC Peering Connections (0), Network ACLs (1), Security Groups (6), Customer Gateways (0), and Virtual Private Gateways (0). A "Service Health" section indicates "Service is operating normally" for Amazon EC2 - US East (N. Virginia). The "Settings" section includes links for Zones and Console Experiments. The "Additional Information" section links to VPC Documentation, All VPC Resources, Forums, and Report an Issue. The "Transit Gateway Network Manager" section explains its purpose of centrally managing global network across AWS and on-premises.

2 Navigate to the VPC Dashboard. Here you will see a “**Launch VPC Wizard**” click on it. This is the “VPC creation” wizard. Here you can find 4 different options:

1. VPC with Single Public Subnet, the one we are going to choose.
2. VPC with Public and Private Subnets.
3. VPC with Public and Private Subnets and Hardware VPN Access.
4. VPC with a Private Subnet only and Hardware VPN Access.

So, let's start by creating a VPC with a single public subnet. Click on “*Select*“.

The screenshot shows the AWS VPC Wizard Step 1: Select a VPC Configuration. On the left, there are four options: "VPC with a Single Public Subnet" (selected), "VPC with Public and Private Subnets", "VPC with Public and Private Subnets and Hardware VPN Access", and "VPC with a Private Subnet Only and Hardware VPN Access". The "VPC with a Single Public Subnet" option is highlighted with a blue border. To its right, there is a description: "Your Instances run in a private, isolated section of the AWS cloud with direct access to the Internet. Network access control lists and security groups can be used to provide strict control over inbound and outbound network traffic to your instances." Below this is a "Creates:" section: "A /16 network with a /24 subnet. Public subnet instances use Elastic IPs or Public IPs to access the Internet." There is also an "Important:" note: "If you are using a Local Zone with your VPC follow this link to create your VPC." At the bottom of the main area is a "Select" button. In the bottom right corner of the page, there are links for "Feedback", "English (US)", "Privacy Policy", and "Terms of Use".

3 Here you will have to mention a few details for creating your VPC.

- The IPv4 CIDR block VPC Name
- Public Subnet's IPv4 CIDR
- Availability Zone where you want your VPC to be created
- Subnet name
- Hardware tenancy

After mentioning all the details, click on “*Create VPC*“.

Step 2: VPC with a Single Public Subnet

IPv4 CIDR block*: 10.0.0.0/16 (65531 IP addresses available)

IPv6 CIDR block: No IPv6 CIDR Block
 Amazon provided IPv6 CIDR block
 IPv6 CIDR block owned by me

VPC name: Exp-8

Public subnet's IPv4 CIDR*: 10.0.0.0/24 (251 IP addresses available)

Availability Zone*: us-east-1a

Subnet name: Public subnet

You can add more subnets after AWS creates the VPC.

Service endpoints

Add Endpoint

Enable DNS hostnames*: Yes No

Hardware tenancy*: Default

[Cancel and Exit](#) [Back](#) [Create VPC](#)

Feedback English (US) ▾ © 2008 - 2020, Amazon Web Services, Inc. or its affiliates. All rights reserved. [Privacy Policy](#) [Terms of Use](#)

4 You will get a message saying “Your VPC has been successfully created”. Click on “OK”.

5 In the “Your VPC” section, you can see that there is a new VPC named “Exp-8” created.

Your VPCs (2) Info						
	Name	VPC ID	State	IPv4 CIDR	IPv6 CIDR (Netwo	
<input type="checkbox"/>	-	vpc-35748c48	Available	172.31.0.0/16	-	
<input type="checkbox"/>	Exp-8	vpc-0850f37af17635e98	Available	10.0.0.0/16	-	

6 Now let's verify the public subnet. You can see that a subnet named "Public Subnet" is created. This subnet has a route table attached which consists of local and public access with an Internet Gateway.

The screenshot shows the AWS VPC console interface. On the left, there is a navigation sidebar with options like New VPC Experience, VPC Dashboard, Filter by VPC, and a list of VPC-related services including Subnets, Route Tables, Internet Gateways, Egress Only Internet Gateways, Carrier Gateways, DHCP Options Sets, Elastic IPs, Managed Prefix Lists, Endpoints, Endpoint Services, NAT Gateways, and Peering Connections. Below this is a SECURITY section with Network ACLs.

The main area displays two tables:

- Subnets (1/7) Info**: A table showing seven subnets. One subnet, "Public subnet" (subnet-035bf100e56d08447), is selected and highlighted with a checkmark. The other six subnets are unselected. The columns include Name, Subnet ID, State, VPC, and IPv4 CIDR.
- Routes (2)**: A table showing two routes. The first route, "10.0.0.0/16", has a target of "local". The second route, "0.0.0.0/0", has a target of "igw-0dc970411b2a9287c".

At the bottom of the page, there is a URL bar showing the address https://console.aws.amazon.com/vpc/home?region=us-east-1# and a footer with copyright information and links to Privacy Policy and Terms of Use.

Name	Subnet ID	State	VPC	IPv4 CIDR
Public subnet	subnet-035bf100e56d08447	Available	vpc-0850f37af17635e98 Exp-8	10.0.0.0/24
-	subnet-a71574a9	Available	vpc-35748c48	172.31.64.0/20
-	subnet-4aae0615	Available	vpc-35748c48	172.31.32.0/20
-	subnet-e79339c6	Available	vpc-35748c48	172.31.80.0/20
-	subnet-d35c239e	Available	vpc-35748c48	172.31.16.0/20
-	subnet-2b26d51a	Available	vpc-35748c48	172.31.48.0/20

Destination	Target
10.0.0.0/16	local
0.0.0.0/0	igw-0dc970411b2a9287c

Experiment 9

Aim: To Create a DynamoDB table and perform both query and scan searches of the table

Introduction:

Amazon DynamoDB is a fully managed NoSQL database service that provides fast and predictable performance with seamless scalability. DynamoDB lets you offload the administrative burdens of operating and scaling a distributed database so that you don't have to worry about hardware provisioning, setup and configuration, replication, software patching, or cluster scaling.

DynamoDB also offers encryption at rest, which eliminates the operational burden and complexity involved in protecting sensitive data. For more information, see [DynamoDB Encryption at Rest](#).

With DynamoDB, you can create database tables that can store and retrieve any amount of data and serve any level of request traffic. You can scale up or scale down your tables' throughput capacity without downtime or performance degradation. You can use the AWS Management Console to monitor resource utilization and performance metrics.

Steps to Create a Dynamo DB Table:

- 1 Go to Amazon Dynamo DB
- 2 Click on CREATE TABLE

The screenshot shows the Amazon DynamoDB console preview interface. At the top, there are several informational banners: one about the preview being available, another about exporting to S3, and a third about the redesign. Below these, the main header features the Amazon logo and the text "Amazon DynamoDB". A large blue circular icon with a stylized 'D' is centered above the header. The main content area contains a brief description of what DynamoDB is and a prominent blue "Create table" button. At the bottom, there's a link to a "Getting started guide". The footer includes standard AWS links for feedback, language selection, copyright information, privacy policy, and terms of use.

The screenshot shows the AWS DynamoDB 'Create item' dialog box. On the left, a sidebar lists services like Tables, Backups, Reserved capacity, Preferences, DAX, and Dashboard. The main area displays a tree view of three items under 'Item (3)'. The first item is 'OrderID Number: 24', the second is 'OrderName String: General Order', and the third is 'OrderStatus Boolean: False'. At the bottom right of the dialog are 'Cancel' and 'Save' buttons. Below the dialog, a message box states: 'You do not have the required role to enable Auto Scaling by default. Please refer to documentation.' The footer includes links for Feedback, English (US), Privacy Policy, and Terms of Use.

3 Click on CREATE ITEM to add items in the table that we have created.

The screenshot shows the AWS DynamoDB 'Items' tab for the 'Order' table. The top navigation bar includes tabs for Overview, Items (which is selected), Metrics, Alarms, Capacity, Indexes, Global Tables, Backups, and More. Below the tabs are 'Create item' and 'Actions' buttons. The main area displays a search interface with a dropdown menu set to 'Scan' and a query: '[Table] Order: OrderID'. A filter is applied with 'Filter' set to 'OrderName', 'String' type, 'Contains' condition, and value 'Tom's'. A 'Start search' button is at the bottom. The status bar indicates 'Viewing 1 to 1 items'.

4 The Table is created and ITEMS are added into the Table.

Order		Close																									
		Overview	Items																								
		Metrics	Alarms																								
		Capacity	Indexes																								
		Global Tables	Backups																								
		More

Experiment 10

Aim: To Create CloudFront Distribution using Amazon S3.

Introduction: Amazon CloudFront is a web service that speeds up distribution of your static and dynamic web content, such as .html, .css, .js, and image files, to your users. CloudFront delivers your content through a worldwide network of data centres called edge locations. When a user requests content that you're serving with CloudFront, the user is routed to the edge location that provides the lowest latency (time delay), so that content is delivered with the best possible performance.

- If the content is already in the edge location with the lowest latency, CloudFront delivers it immediately.
- If the content is not in that edge location, CloudFront retrieves it from an origin that you've defined—such as an Amazon S3 bucket, a Media Package channel, or an HTTP server (for example, a web server) that you have identified as the source for the definitive version of your content.

STEPS TO CREATE CLOUDFRONT DISTRIBUTION

1 Go to S3 services and CREATE Bucket.

2 Provide the Bucket Name and uncheck the **Block all Public Access** and check the **Acknowledgement box**.

The screenshot shows the 'General configuration' section of the AWS S3 console. A bucket named 'riri1' is being created in the 'US East (N. Virginia) us-east-1' region. The 'Copy settings from existing bucket - optional' section is collapsed. Below it, the 'Bucket settings for Block Public Access' section is expanded, showing two options: 'Block all public access' (unchecked) and 'Block public access to buckets and objects granted through new access control lists (ACLS)' (unchecked). A note explains that turning 'Block all public access' on is equivalent to turning on four other settings. At the bottom of this section is a note about turning off block all public access potentially making the bucket and its objects public. A checkbox for acknowledging this risk is checked.

Turning off block all public access might result in this bucket and the objects within becoming public
AWS recommends that you turn on block all public access, unless public access is required for specific and verified use cases such as static website hosting.

I acknowledge that the current settings might result in this bucket and the objects within becoming public.

3 Upload the Image by clicking on the Upload button.

The screenshot shows the 'Objects (0)' section of the AWS S3 console. It includes a toolbar with 'Delete', 'Actions', 'Create folder', and 'Upload' buttons, and a search bar. A message states 'No objects' and 'You don't have any objects in this bucket.' An 'Upload' button is visible at the bottom.

4 Now we have created our object using S3, now go to CloudFront and click on CREATE DISTRIBUTION.

The screenshot shows the AWS CloudFront 'Get started' page. The left sidebar includes links for 'Distributions', 'Policies', 'What's new', 'Telemetry', 'Monitoring', 'Alarms', and 'Logs' (with a 'NEW' badge). The main content area has a header 'How to accelerate your dynamic content with Amazon EC2 as an origin. [Learn more](#)' with a close button. Below it is the title 'Amazon CloudFront - Get started' with a help icon. A message states: 'Either your search returned no results, or you do not have any distributions. Click the button below to create a new CloudFront distribution. A distribution allows you to distribute content using a worldwide network of edge locations that provide low latency and high data transfer speeds ([learn more](#))'. A blue 'Create Distribution' button is centered. The top navigation bar shows the AWS logo, services dropdown, user info (vocstartsoft/user871236=dgupta6_be17@thapar.edu @ 8298-9774-0151), global support dropdown, and a close button.

5 We will be creating the CloudFront using the WEB.

The screenshot shows the 'Step 1: Select delivery method' screen. It features a sidebar with 'Step 1: Select delivery method' (highlighted in orange) and 'Step 2: Create distribution'. The main content area is titled 'Select a delivery method for your content.' with a help icon. It contains a 'Web' section describing how to create a web distribution and a bulleted list of benefits. Below it is an 'RTMP' section with a note about discontinuing support. A 'Get Started' button is located at the bottom of the 'Web' section. The top navigation bar is identical to the one in the first screenshot.

6 We will give Domain name that we have created earlier using S3 service.

Step 1: Select delivery method

Step 2: Create distribution

Create Distribution

Origin Settings

Origin Domain Name: riri1.s3.amazonaws.com

Origin Path: /

Origin ID: open-web-1228897288.us-east-1.elb.amazonaws

Origin Custom Headers: No Accessible Origins

Value: Failed to List your origins

7 Create txt file and write the html content in it and instead of Domain name give the name Domain name that you have get after creating the CloudFront.
